Hip Endoprosthesis System

Aesculap Orthopaedics

# Excia®

## Excellence in Arthroplasty

The Excia® Hip System is based on many years of experience with straight stem implants in France, where the first Excia® was implanted in April 2000.

Today, the Excia® system is used successfully throughout Europe, the US and Japan.

The Excia® system concept of using one instrument set for implantation with or without bone cement is time tested and has been subject to ongoing enhancements.

Excia® is one of the most important products in the Aesculap hip endoprosthesis range.

### 15 Years of Excia®

**2000**

Start Excia®  
Implantations

**2001 – 2004**

- Excia® Caspar Implantations
- Excia® Experience Meeting Lyon
- Excia® OrthoPilot® Navigation
- FDA Approval in USA

**2005**

1st Excia® in USA

**2006 – 2009**

- Excia® L 8/10 High Offset
- Excia® 12/14
- Excia® Curved MIS Wingprofiler
- MHLW Approval in Japan

**2010**

Excia® 10 Years

**2011 – 2014**

- Excia® Hip Platform
- SFDA Approval in China
- More than 95,000 Excia® sold
- Publication on Excia® 7 year results

**2015**

Excia® 15 Years

# Excia®

## Excellence in Arthroplasty

### Distinguished by

... design  
... technique  
... surface

The prosthesis design, implantation technique and implant surface form the foundation for success in primary hip replacement surgery.

Excia® is implanted using a rasp that works for both the cementless stem and the cemented stem with a distal centralizer.

The lateral offset of the Excia® stem increases with stem size, further enhancing the stability of the joint.

Excia® can be implanted with computer navigation and supports less invasive surgical techniques, thus making it well-equipped for the needs of advanced hip replacement surgery.

# Excia®

## Excellence in Arthroplasty

Distinguished by ... design

The Excia® straight stem is designed for implant longevity with or without bone cement – with standard or high offset.

### Cementless design

Stem design with distal fit and proximal flanges for mechanical stability. Proximal fixation with the Plasmapore® coating.

### Cemented design

Wingless stem design preserves bone near the trochanter. Flanges allow a good proximal fit within the cement mantle.

Perfect stem alignment with the distal centralizer.

Two design options for implantation  
with or without bone cement  
with standard or high offset

# Excia®

## Excellence in Arthroplasty

Distinguished by ... technique

Lateral wing

Cementless and cemented Excia® stems differ by material, surface and especially by the lateral wing.

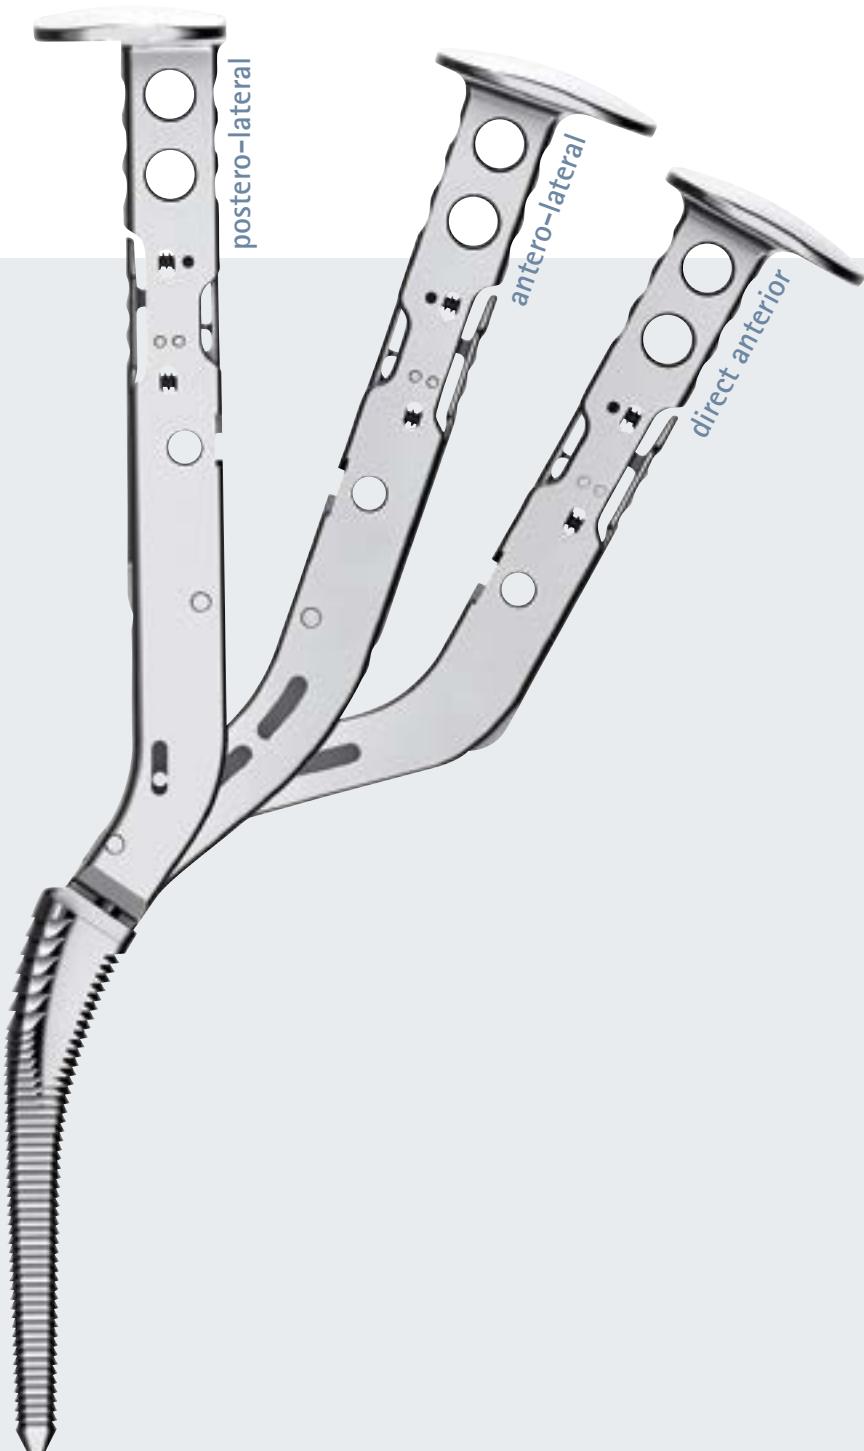

### Rasps

The wing rasp is only used in the final step of the cementless implantation.

The modular trial necks with standard or high offset offer the possibility to simulate an optimal soft tissue reconstruction.

The stem rasps are so precisely machined that the trial reduction mimics the final implant accurately.

**One instrument set for implantation  
with or without bone cement  
for all surgical approaches**

# Excia®

## Excellence in Arthroplasty

Distinguished by ... surface

### Implant surface

The cementless Excia® features a proximal rough Plasmapore® porous coating.

### Plasmapore®

The rough 0.35 mm microporous pure titanium coating leads to direct bone apposition in the proximal part of the implant.

### Results

This is confirmed by long-term clinical experience with various cup and stem implants coated with Plasmapore® since 1987.

Plasmapore® -

Aesculap's leading surface coating technology  
with more than 25 years of clinical experience

# Excia®

## Surgical Technique

### Osteotomy

The osteotomy angle is 55 degrees. All markings on the instruments and implants are in 55° reference to this plane.

### Opening the medullary canal

The medullary canal is opened with a box osteotome, which is inserted postero-laterally and determines the femoral anteversion angle of the implant.

### Starter rasp

The starter rasp is an optional instrument which is used manually without any force to check the intramedullary situation. There is no need to use a hammer.

#### Rasp

The medullary canal is prepared with increasing sized rasps until the desired depth and stability are achieved.

#### Trial Reduction

In combination with the Excia® rasp the two modular trial necks with standard (135°) or high offset (128°, + 6 mm) simulate exactly the Excia® implant geometry.

The appropriate trial heads enable finally trial reduction and joint inspection with the Excia® rasp.

# Excia® Surgical Technique

Cement mantle thickness	Rasp size	Excia® stem size	Distal centralizer size
1.0 mm	12	12	12
1.5 mm	12	11	12
2.0 mm	12	10	12

## Cemented implantation

For a cemented implantation the Excia® stem and centralizer sizes are selected according to the table above. The distal centralizer size always corresponds to the size of the last rasp used.

The required thickness of the cement mantle can be adjusted from 1 to 2 mm, depending on the size of the final implanted stem.

#### Cementless implantation

For a cementless implantation, a groove for Excia®'s lateral wing is incised with the wing profiler, which is guided down a slot in the final stem rasp. The cementless Excia® stem can be implanted after the trial reduction.

The size of the cementless Excia® stem corresponds directly to the final stem rasp for a proper press-fit. The stem impactor controls the rotational alignment during implantation.

#### Biomechanical concept

Primary stability is achieved by a precise fit of the distal stem and rotational stability in the proximal area. Secondary stability results from bony ingrowth into the Plasmapore® coating.
